

AL 39

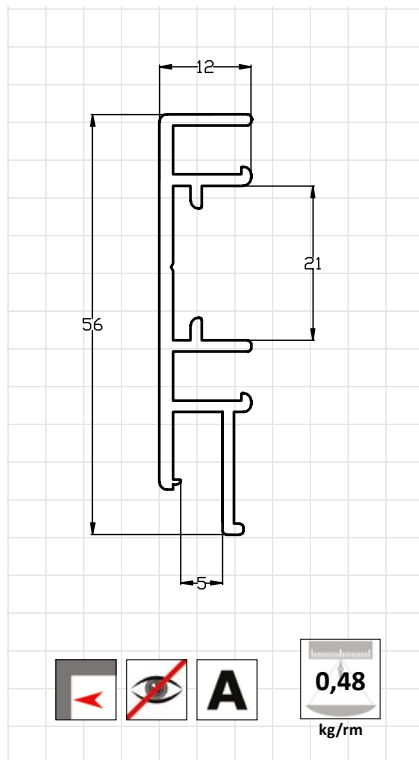

ALUMINUM MODULAR PROFILE

Lightweight wall aluminum profile for creating light panels and art ceilings. The design of the profile allows installation of stretch materials on 3 different levels. This profile is used for creating rectangular shapes. Can not be bent. To create angles it is necessary to cut it precisely in 45-degree angles and mount together.

Design of this profile opens several possibilities for its use. First of all it can be used for the installation of backlit translucent (printed) stretch ceilings. The other variant is to create multi-layered art ceilings with cut-out patterns. This profile is ideal for this application. The top layer is a protective layer, the middle layer is a white or colored (printed) film, and the bottom layer is a membrane with artistic perforations.

DIMENSIONS

To prevent dust and organic impurities inside the structure we recommend installation of CLEAR translucent material as a top layer.

In backlit ceilings we instal special Diffusion translucent membrane as a middle layer to make homogeneous light diffusion.

And the bottom layer that is visible can be of different materials, depending on your design needs and imagination - mirror, colored, translucent, art-cutted or image printed.

Sound absorption function: by adding the option of micro-perforation to the membranes, it is possible to improve the acoustic properties of the room.

Variants of ceilings with AL 39

(2-3 layers of stretch ceiling depending on the needs)

- Backlit ceiling (3 film layers)
- Printed backlit ceiling (2-3 film layers)
- Acoustic backlit ceiling (2 film layers with perforation)
- Art-cutted ceiling. Also can be acoustic and backlit (2 - 3 layers of film).

ART BACKLIT CEILING
